

AIDAY

HOSTED BY ANOTE

Hannah Qi

(Anote Summer 2025 Intern)

01

Autonomous Intelligence

Overview of my work this summer

02

Browser Use

Introducing an interesting AI tool

Autonomous Intelligence

building collaborative **multi-agent** AI systems

My main focus:

Task:

Build the first iteration of the Autonomous Intelligence product by implementing various [chatbot functionalities](#)

Guest Access

Allow any user to interact with the chatbot, but more advanced features are exclusive to authenticated users

Playbook Sharing

Collaborated with another intern to build a system where authenticated users are able to generate playbook sharing links, which are viewable by both incognito and other authenticated users. Interacting with these links will load the playbook and playbook history associated with the link

Guest Access

Authenticated Users

Chat Functionality

Creating Multiple Chats

Chat History

Switching Models

File Uploads

Incognito Users

Chat Functionality

File Uploads

How to Interact as a Guest

Step 1: Click "Try Free"

→ This will lead you to a chat environment that gives you access to the features available to incognito users

Step 2: Start Chatting

→ Upload files and talk with the chatbot as usual

Want Full Features?

→ You can always go back to the homepage and sign up through the "get started" button

How to Interact as a Guest

Playbook Sharing

Access playbook sharing URL feature through button access on your desired chat

The goal of this feature is to allow users to **collaborate** within the same chat space by allowing playbooks to be shared via unique links

How it Works

STEP 2: Paste the link in another tab or share it with a friend to view the chat and its history

How it Works

Browser Use

introducing **browser automation**

Core Purpose

AI agents can navigate the web (much like a regular user) and perform a variety of actions

LLM integration

- Connects LLMs like GPT, Claude, Gemini, Deepseek, etc. with the browser
- Allows LLM to provide reasoning over live website information

→ Editing Google Docs

→ Applying to Jobs

→ Booking Flights

How Does It Work?

Main Features:

Utilizes **LangChain** to connect language models and provides an **Agent class** which provides powerful customizations

Agent Class:

you can provide agents with text instructions and also implement custom features

- Two required parameters for making an agent are "task" and "llm"
- **task:** instructions for the llm
- **llm:** LangChain chat model instance

How Does It Work?

Additional Features

use_vision

Allows agent to process visual information from web pages

Planner Model

Specify a separate LLM for planning high level tasks

Memory Organization

Stores procedural memory using Mem0

Core Operation:

- asynchronous agent.run()
 - returns AgentHistoryList
- contains information on:
 - Urls visited
 - Screenshots taken
 - Actions executed
 - Content extracted
 - Any errors that occurred

**Useful for
debugging,
learning, and
improving based
on your agent's
behavior!**

Connecting To Your Browser

New Browser

- Default method
- Launch using Chromium via **playwright**
- built-in

Remote Browser

- Use **CDP** (chrome devtools protocol) or **WSS** (WebSocket Secure)
- Point your agent to the endpoint
- Can connect to instances in the cloud or another machine

Existing Browser

- Use existing playwright Page, BrowserContext, or Browser object
- Connect to running local browser with **browser_pid**

Thanks!
